

# Transportation Resilience & its impact on Project Determination

Theodore Zoli

February 16, 2019

# Resiliency vs Sustainability

Sustainability – systemic evaluation of future options and devising strategies to obtain a desired outcome

Resiliency – adaptive capacity and robustness to gracefully weather inevitable but unspecified shocks

# Resiliency – Transportation Sector

- Network Behavior of the transportation system
  - Bridges, Detour Route, & Fragility
  - Evacuation Route & Emergency Access
  - Operational performance and mode shifts
  - The Advent of Superusers
  - The need for Hardened Corridors
- Interdependencies & Hyper-connectivity
  - Other lifelines & access for assessment / recovery
  - Transportation / Power / Internet - cascading effects
- Non-stationarity
  - Changing return periods & deterministic design
  - Demographic shifts and unexpected behavior

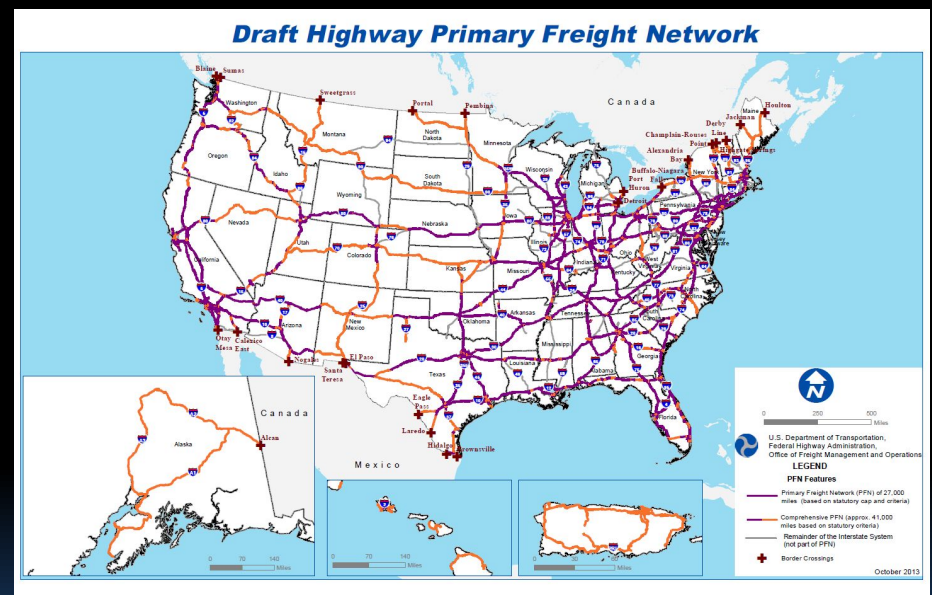

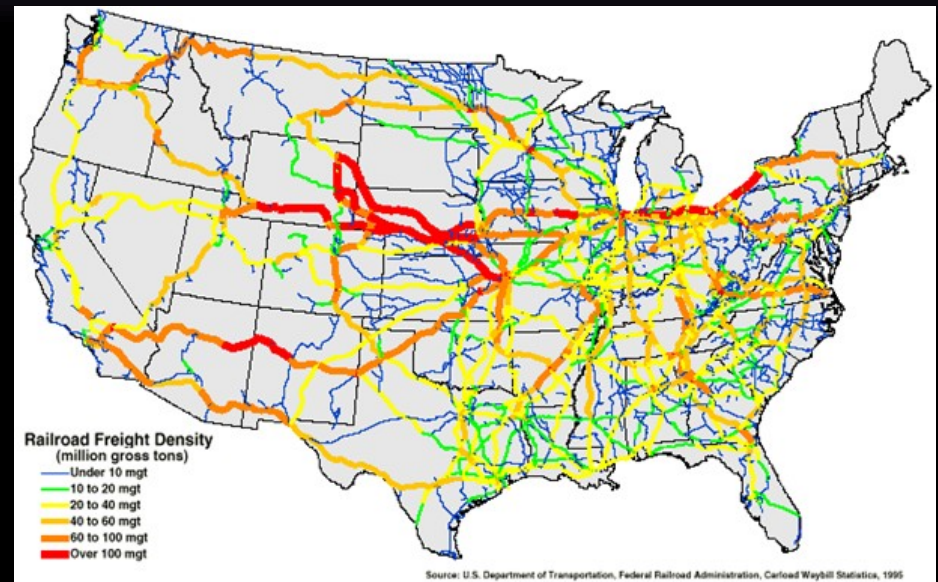

# Network Performance & Fragility

## FRAGILE NETWORKS

Identifying Vulnerabilities and Synergies  
in an Uncertain World

*Anna Nagurney / Qiang Qiang*

# NIST Community Resilience Interdependencies

## TOWARD A MORE RESILIENT COMMUNITY

An Overview of the Community Resilience Planning Guide for Buildings and Infrastructure Systems

**NIST**  
National Institute of  
Standards and Technology  
U.S. Department of Commerce

The *Guide* was developed by NIST in collaboration with public and private stakeholders from state, local, and federal governments, utilities, regulators, standards developers, industries, and academia.

It provides an adaptable, flexible method that allows any community to develop individualized long-term resilience plans and goals, based on available resources and needs. It details a six-step planning process that a community can use to tailor to its particular circumstances.

The following pages explain more about the recommended six steps.

Just taking the first step can help your community move toward greater resilience. The complete *Guide* follows the process as it is put into practice in the hypothetical city of Riverbend, USA.

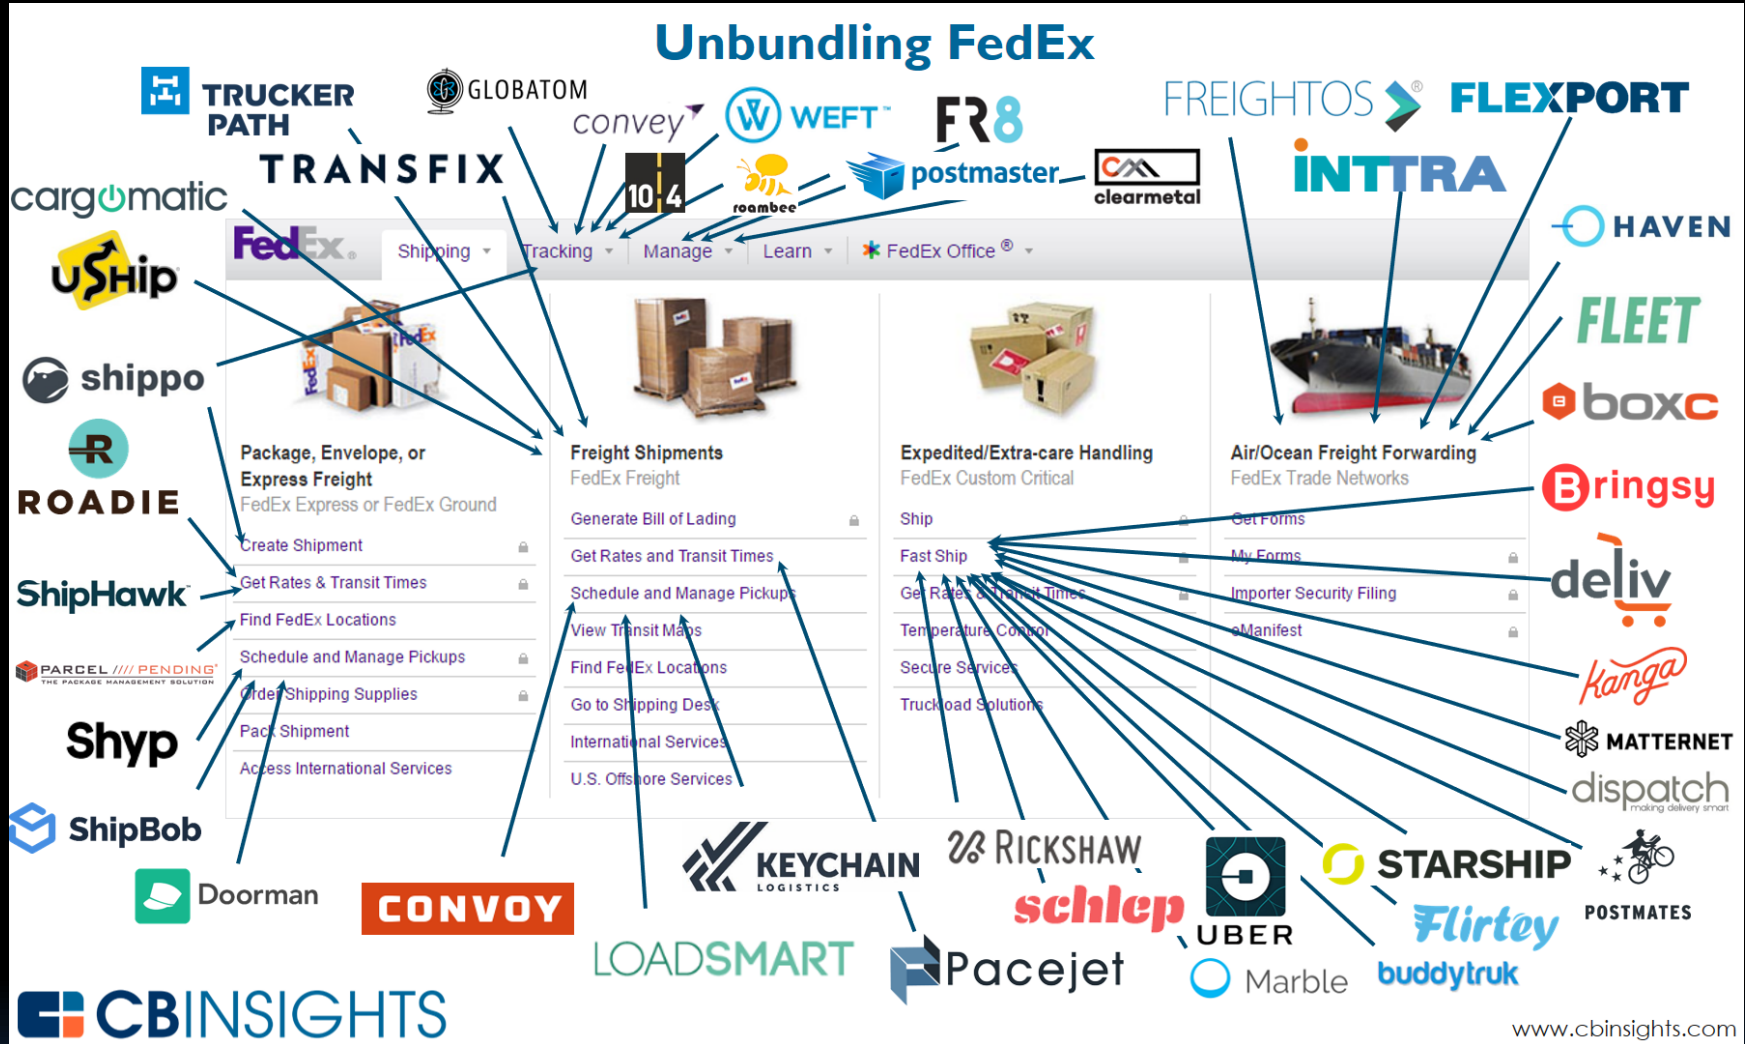

# Functional vs Operational Fragility

- Disruption Time
  - Operational – measured in minutes / hours
  - Functional – Days/Weeks/Months
- Network Investment Strategies
  - Route flexibility – network redundancy / modal redundancy
  - Corridor enhancement – increased throughput
  - Selective de-commissioning

# Superusers – Trucking Logistics

- Route Optimization
- Telematics & Instantaneous Feedback
- Durable Dataset
- How to Engage Trucking Industry to
  - Determine Investment Needs
  - Project Definition
    - Weight / Geometry / Robustness in Corridors
  - Influence not so super-users

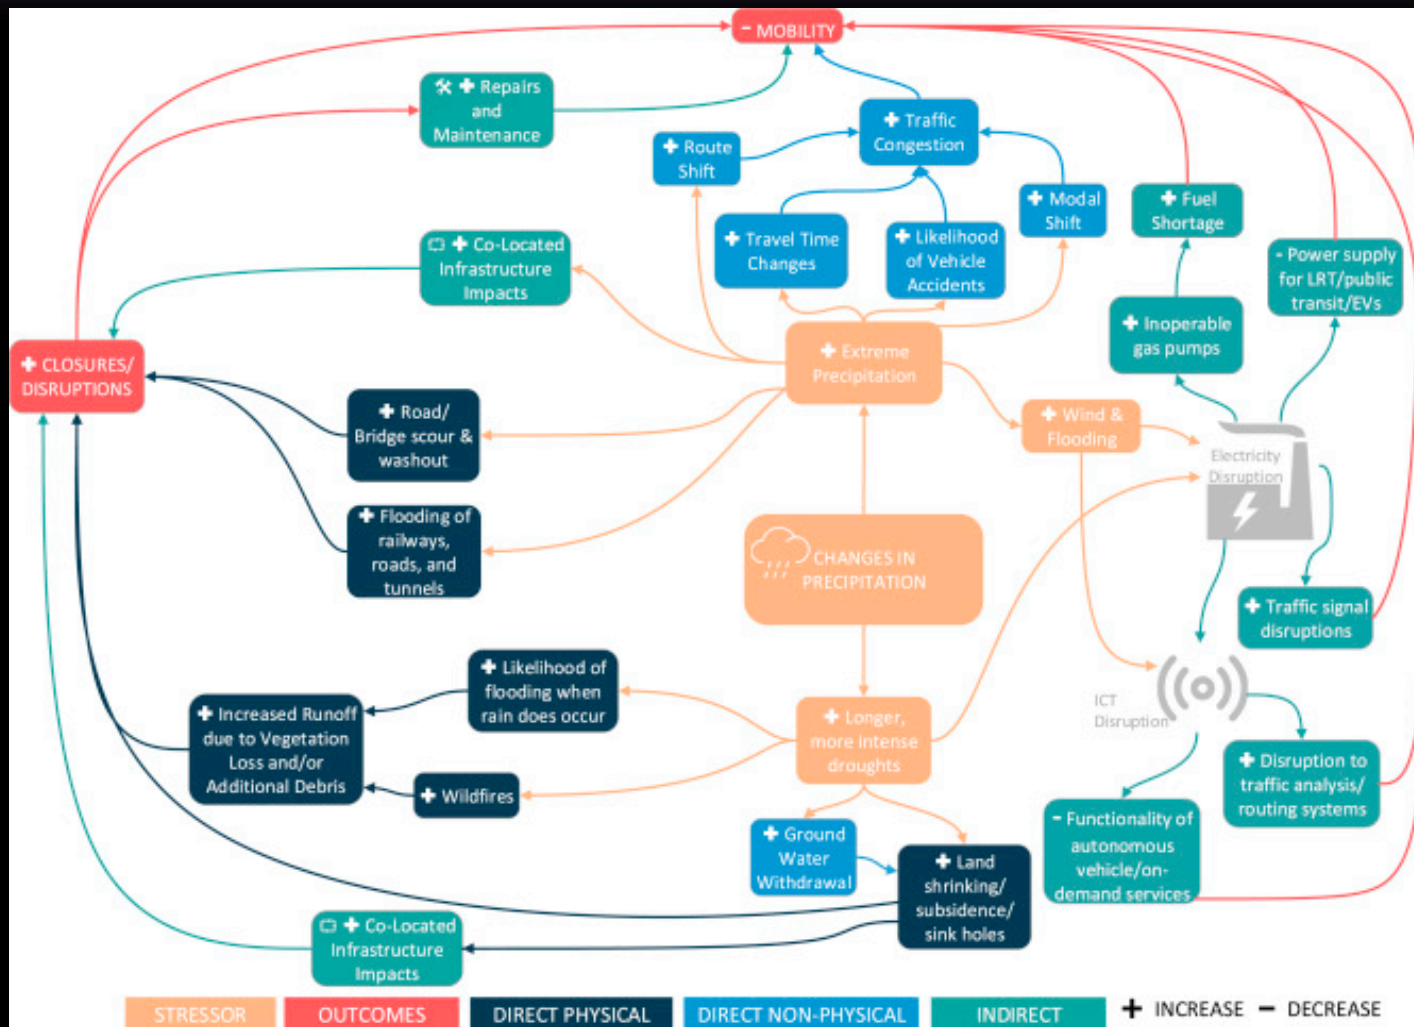

# Explosion of Logistics Companies

# Influence not so super-users thought experiment

- Is our commute time or are children any less valuable than our amazon package?
- What if bus routing was as sophisticated as UPS, USPS, Fedex?
- How to incentivize coordination between competing users
- How to better game repetitive trips, like our commute.
- Does this need to be fee based?

# Pathways to Disruption

Markolf et al, Journal of Transport Policy, Nov 2018 *Transportation resilience to climate change and extreme weather events – Beyond risk and robustness*

# Transportation Research Board

## Forecasting & Extreme Events

**TABLE 1 Current Scientific Confidence in Attribution Results  
Varies for Different Types of Extreme Events**

● = high ◐ = medium ○ = low	Capabilities of Climate Models to Simulate Event Type	Quality/Length of the Observational Record	Understanding of Physical Mechanisms that Lead to Changes in Extremes as a Result of Climate Change
Extreme cold events	●	●	●
Extreme heat events	●	●	●
Drought	◐	◐	◐
Extreme rainfall	◐	◐	◐
Extreme snow	◐	○	◐
Tropical cyclones	○	○	◐
Extratropical cyclones	◐	○	○
Wildfire	○	◐	○
Severe convective systems	○	○	○

NOTE: Overall confidence in event attribution is strongest for extreme event types that are adequately simulated in climate models, have a long-term historical record of observations, and are linked to human-caused climate change through an understood and robustly simulated physical mechanism. The entries in this table, which are presented in approximate order of overall confidence, are based on the available literature and are the product of committee deliberation and judgement.

# Built Environment – Beyond Code Investment in Buildings

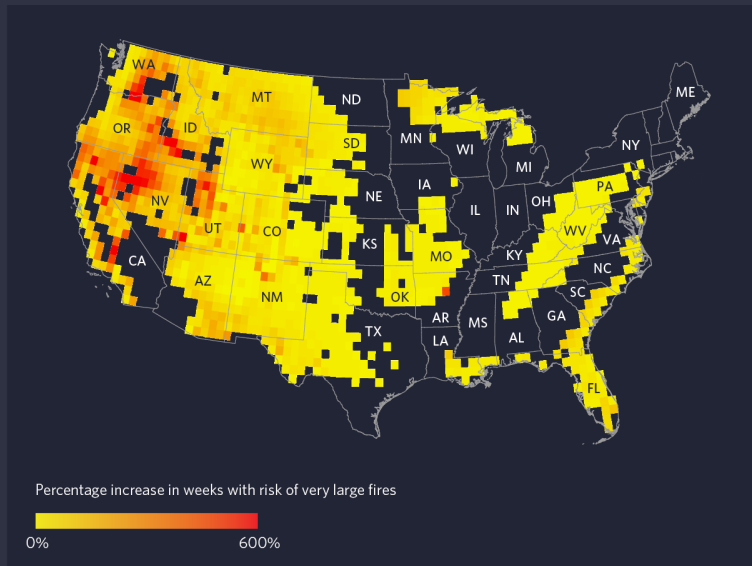

Mitigation Category	Cost	Benefit	BCR
Riverine Flood	\$11.51	\$82.00	<b>7:1</b>
Wind	\$13.60	\$70.00	<b>5:1</b>
Earthquake	\$2.20	\$5.70	<b>3:1</b>
Wildland-Urban Interface Fire	\$0.06	\$0.17	<b>3:1</b>
Total for federal grants	\$27.40	\$157.90	<b>6:1</b>

Table 2. Costs and benefits associated with 23 years of federal grants (in \$ billions).

# Emerging Trends - Large Fire Risk Evacuation & Emergency Response

## Risk of 'Very Large Fires'

The wildfire season is likely to lengthen as the climate changes. By midcentury, the number of weeks when weather will be conducive to a very large fire — defined as a fire that spans over 100,000 acres — will increase sixfold in some parts of the United States.

Source: R. Barbero et al, "Climate change presents increased potential for very large fires in the contiguous United States," *International Journal of Wildland Fire*, 2015.

© 2017 The Pew Charitable Trusts

## Federal Spending on Wildfires

The federal government has spent over \$2 billion on wildfire suppression already in 2017, making it the most expensive wildland firefighting year in history.

# Coastal vs Inland Flood Risk

Figure 2

## High Flood Risk Scores Are Not Limited to the Coasts

Composite flood risk scores for coastal and inland counties

# Extreme Precipitation Frequency & Bridge Risk

FIGURE 1. Heavy Rainfall and Flooding Trends in the U.S.

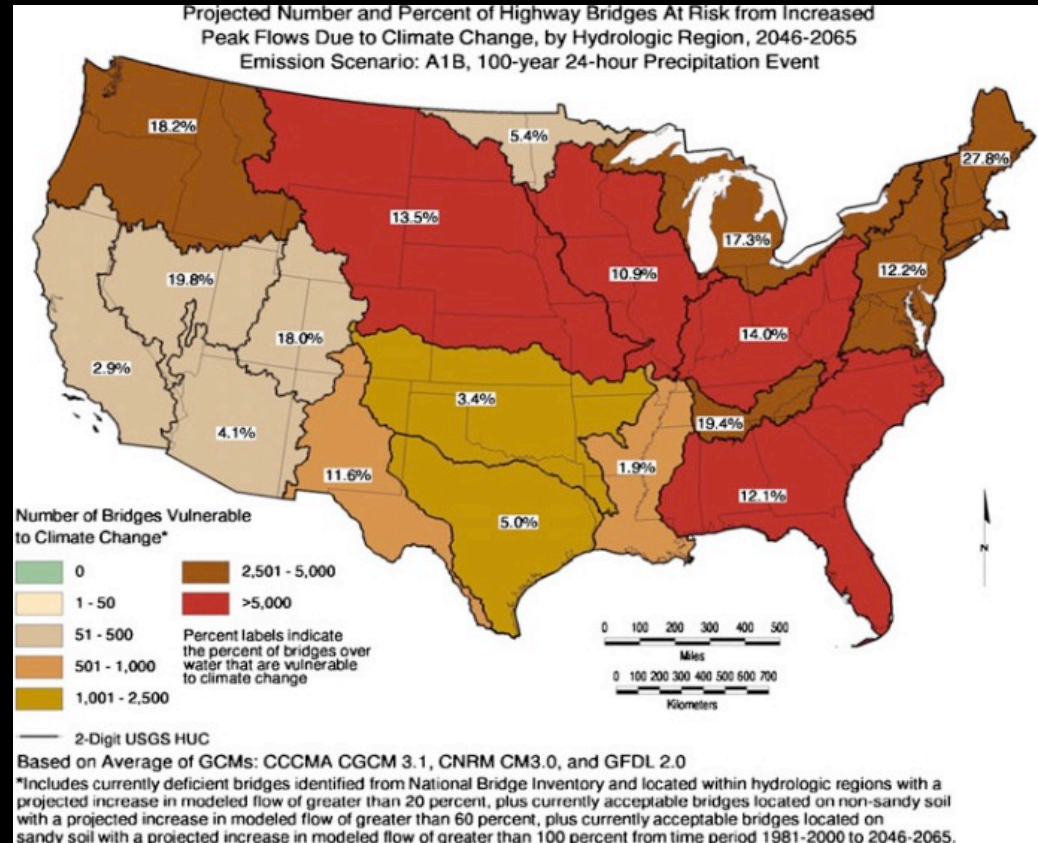

Rainfall increase (%) in heaviest events

0 - 9 10 - 15 16 - 25 26 - 35 36 - 45

Trends in flood frequency

Decrease Increase No significant trend

# Inland Flooding & VTrans

## Hurricane Irene – August 28<sup>th</sup> 2011

- 13 communities inaccessible for days
- State Highway System
  - 500 miles of roadway
  - 200 bridges
- Municipal System
  - 2000 roadway segments
  - 280 bridges
  - 960 culverts

# Hurricane Irene

## Airlift resources to isolated towns

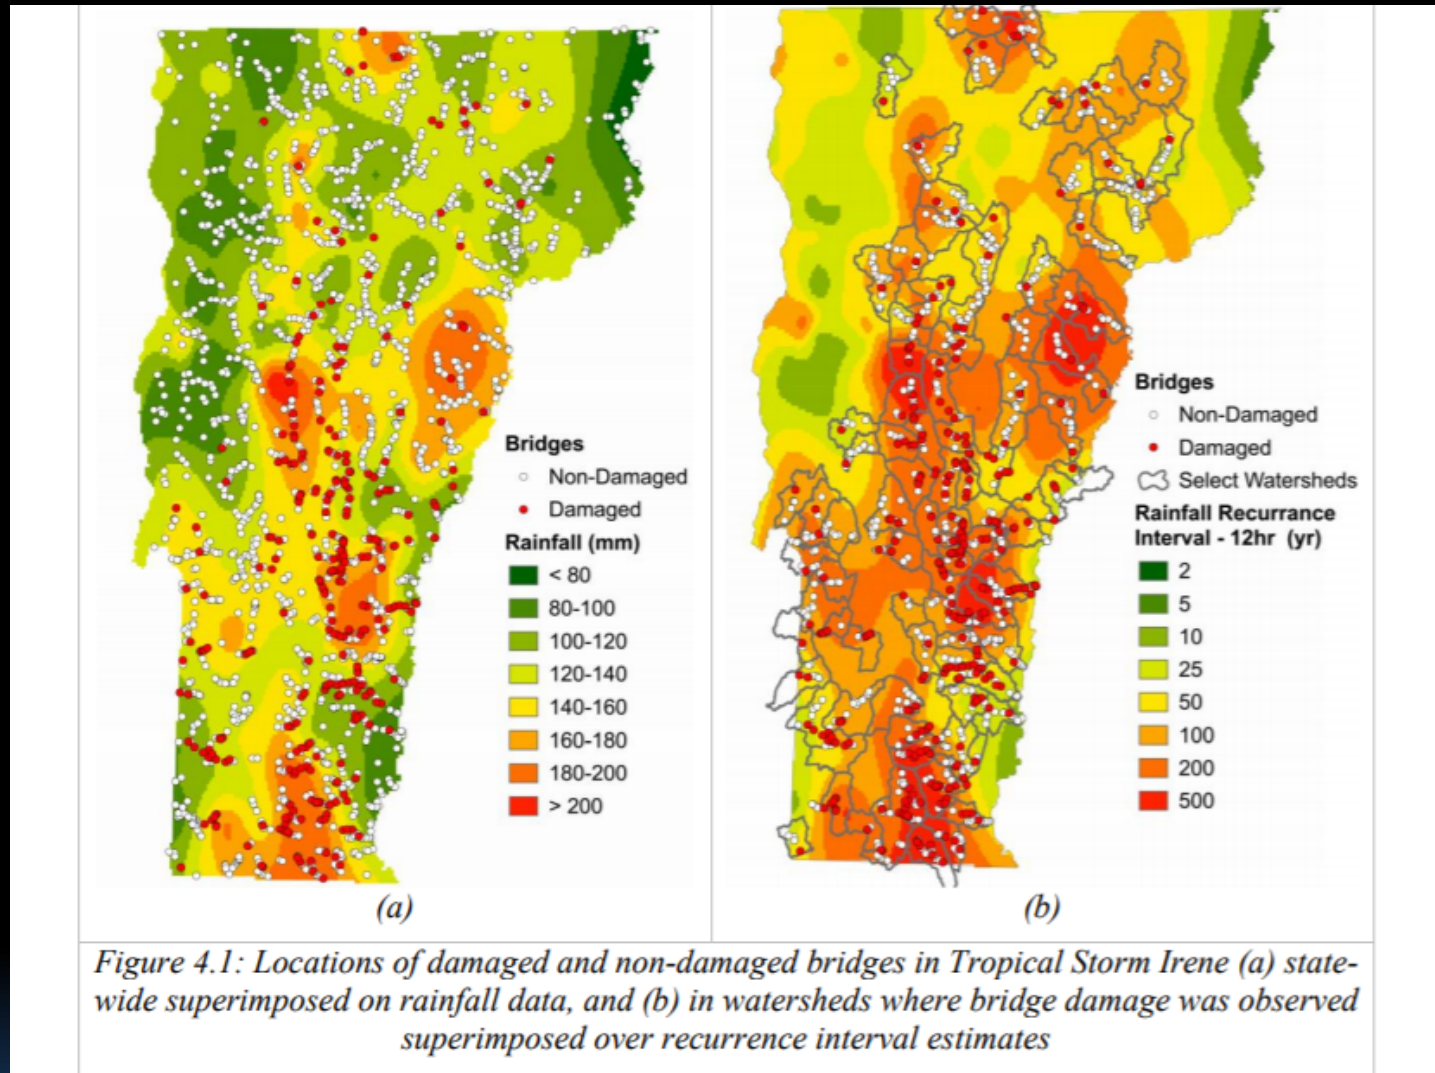

# Hurricane Irene Rapid Road Reconstruction Efforts

# Hurricane Irene

## Extensive Bridge Damage Throughout State

# Hurricane Irene

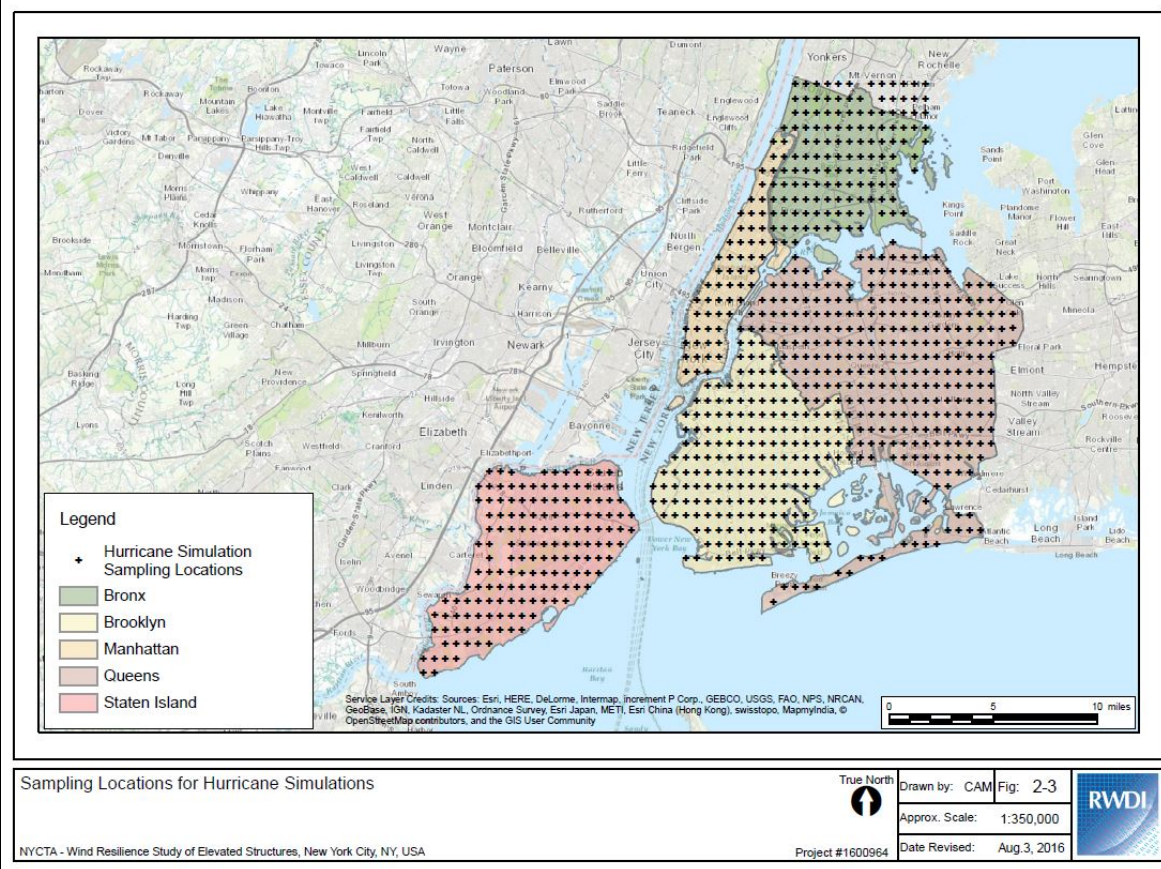

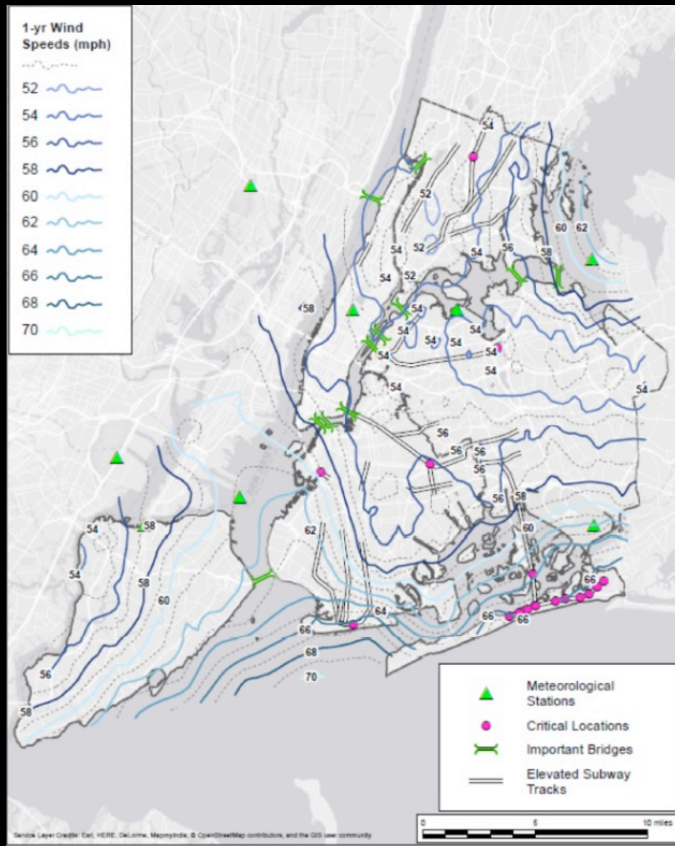

How should we have built it?

How do we build it back?

- Post Damage Reconstruction
  - Need for speed, replace in kind
- Riverine corridor improvements?
  - Hydraulics & bridge damage
  - Emergent Risk with Climate Change
  - Bridge as dam & property damage

# Operational Decision-Making & Blowover Risk Severe Convective Systems

# Severe Convective Systems (High Winds)

## Operational Decision-making & Blowover Risk
